Table of Contents

1. Streams Basics
2. Closing a Stream
3. Types of Streams
4. Combining Streams
5. Files and Directories
6. Serialization

What is Stream?

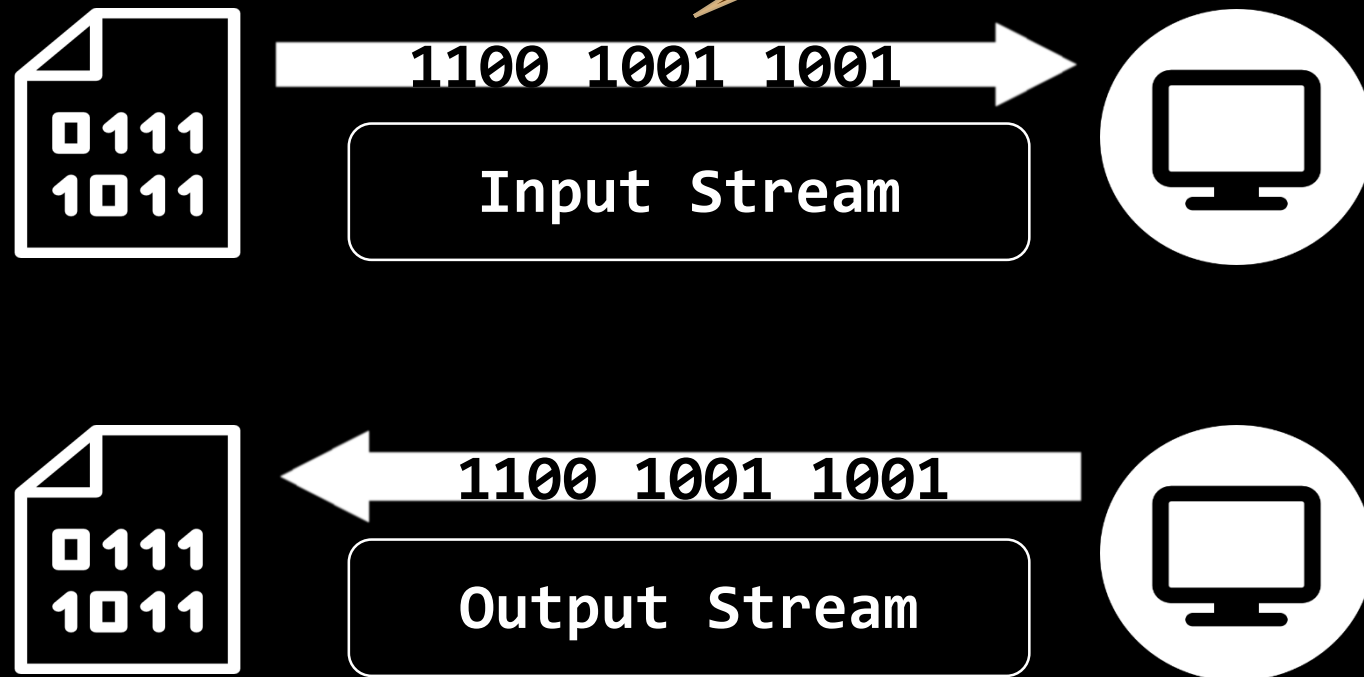

- Streams are used to transfer data
- We open a stream to:
 - Read a file
 - Write to a file

Streams Basics

- Two fundamental types of streams:

Streams are
unidirectional!

Opening a File Stream

```
String path = "C:\\input.txt";
```

```
FileInputStream fileStream =  
    new FileInputStream(path);
```

```
int oneByte = fileStream.read();  
while (oneByte >= 0) {  
    System.out.print(oneByte);  
    oneByte = fileStream.read();  
}
```

Returns -1 if
empty

Closing a Stream

- Using try-catch-finally

```
try {  
    InputStream in = new FileInputStream(path)  
} catch (IOException e) {  
    // TODO: handle exception  
} finally {  
    if (in != null) {  
        in.close();  
    }  
}
```

close() can
also throw an
exception

Always free
resources!

10101

Closing a Stream (2)

- Using try-with-resources

```
try (InputStream in = new FileInputStream(path)) {  
    int oneByte = fileStream.read();  
    while (oneByte >= 0) {  
        System.out.print(oneByte);  
        oneByte = fileStream.read();  
    }  
} catch (IOException e) {  
    // TODO: handle exception  
}
```

Problem: Read File

- You are given a file
- Read and print all of its contents **as a sequence of bytes**
- Submit in Judge **only the output** of the program

Two households, both
alike in dignity,
In fair Verona, where we
lay our scene,

```
1010100 1110111 1101111
100000 1101000 1101111
1110101 1110011 1100101
1101000...
```

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Solution: Read File

```
String path = "D:\\input.txt";

try (InputStream in = new FileInputStream(path)) {
    int oneByte = in.read();
    while (oneByte >= 0) {
        System.out.printf("%s ",
            Integer.toBinaryString(oneByte));
        oneByte = in.read();
    }
}
catch (IOException e) {
    e.printStackTrace();
}
```

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Problem: Write to File

- Read a file and write all its content while **skipping any punctuation** (skip ',', '!', '!', '?')
- Submit in Judge **only the output** of the program

Two households, both
alike in dignity.
In fair Verona, where
we lay our scene.

Two households both
alike in dignity
In fair Verona where
we lay our scene

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Solution: Write to File

```
String inputPath = "D:\\input.txt";  
String outputPath = "D:\\output.txt";  
  
List<Character> symbols = new ArrayList<>();  
Collections.addAll(symbols, '.', ',', '!', '?');  
  
// continues...
```

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Solution: Write to a File

```
try (InputStream in = new FileInputStream(inputPath);
     OutputStream out = new FileOutputStream(outputPath))
{
    int oneByte = 0;
    while ((oneByte = in.read()) >= 0) {
        if (!symbols.contains((char)oneByte)) {
            out.write(oneByte);
        }
    }
} // TODO: handle exceptions
```

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Basic Stream Types in Java

Byte, Character

Byte Stream

- Byte streams are the **lowest level streams**
 - Byte streams can read or write **one byte at a time**
 - All byte streams **descend** from **InputStream** and **OutputStream**

InputStream

100101

111111

100011

-1

OutputStream

100101

111111

100011

Problem: Copy Bytes

- Read a file and **copy** its contents to another text file
- Write characters as **bytes** in decimal
- Write **every space or new line** as it is, e.g. as a space or new line

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Solution: Copy Bytes

```
int oneByte = 0;
while ((oneByte = in.read()) >= 0) {
    if (oneByte == 10 || oneByte == 32) {
        out.write(oneByte);
    } else {
        String digits = String.valueOf(oneByte);
        for (int i = 0; i < digits.length(); i++)
            out.write(digits.charAt(i));
    }
}
```

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Character Streams

- All character streams descend from **FileReader** and **FileWriter**

```
String path = "D:\\input.txt";
```

```
FileReader reader = new FileReader(path);
```

Combining Streams

- Character streams are often "**wrappers**" for byte streams.
 - **FileReader** uses **FileInputStream**
 - **FileWriter** uses **FileOutputStream**

```
String path = "D:\\input.txt";
```

```
Scanner reader =  
    new Scanner(new FileInputStream(path));
```

Wrapping a
Stream

Problem: Extract Integers

- Read a file and extracts all integers in a separate file
- Get only numbers that are not a part of a word
- Submit in Judge only the output of the program

2 households, 22 alike
in 3nity,
In fair Verona, where
we lay our scene

2
22

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

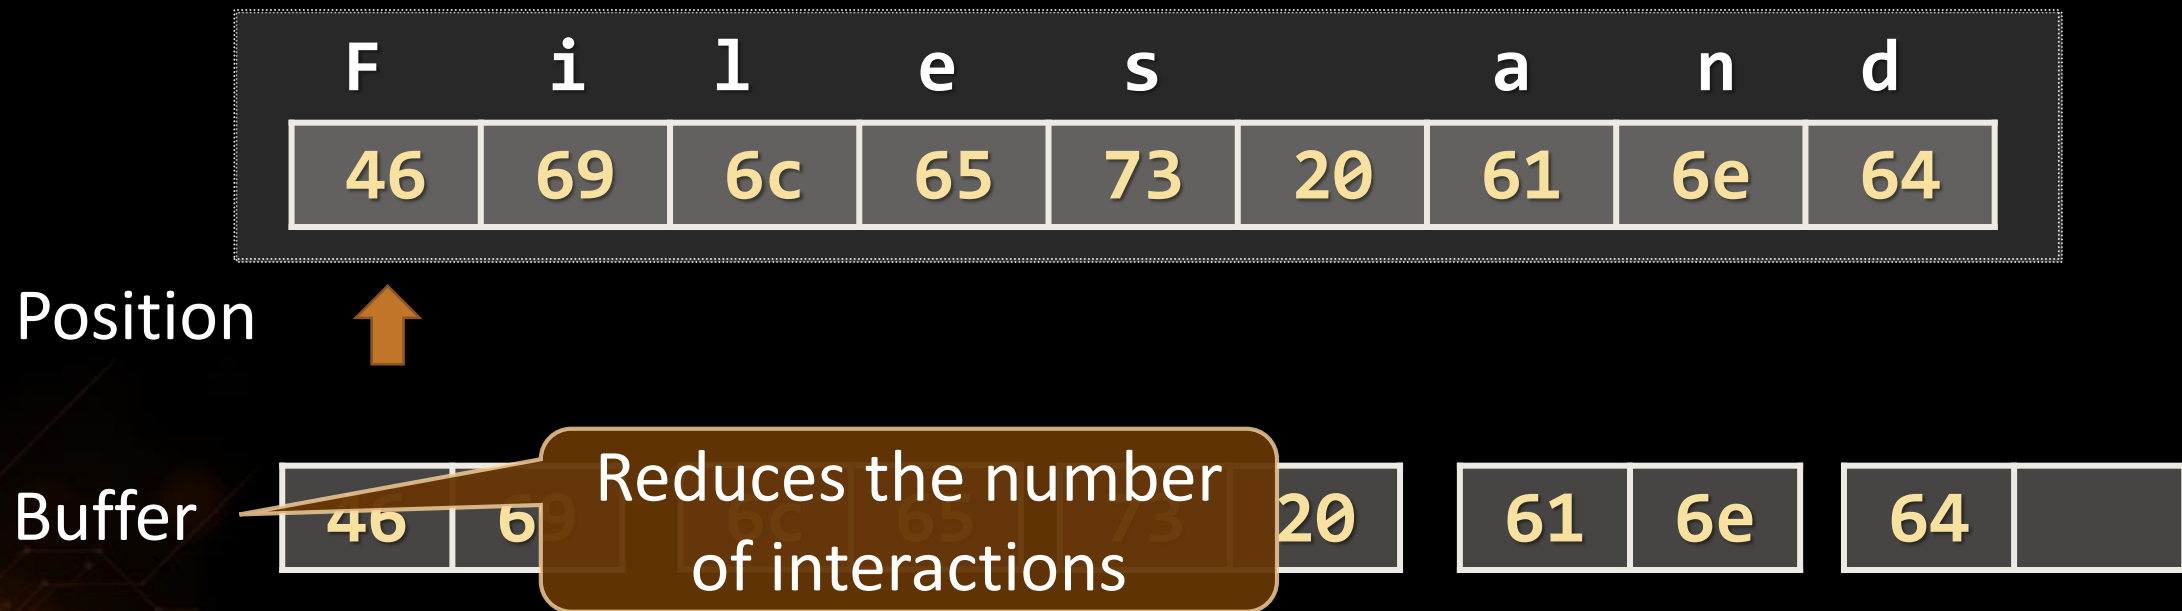

Solution: Extract Integers

```
Scanner scanner =  
    new Scanner(new FileInputStream(inputPath));  
  
PrintWriter out =  
    new PrintWriter(new FileOutputStream(outputPath)) {  
  
while (scanner.hasNext()) {  
    if (scanner.hasNextInt())  
        out.println(scanner.nextInt());  
  
    scanner.next();  
}
```

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Buffered Streams

- Reading information in **chunks**
- Significantly **boost performance**

Problem: Write Every Third Line

- Read a file and write all lines which number is divisible by 3 in a separate file
- Line numbers start from one

Two households, both
alike in dignity,
In fair Verona, where
we lay our scene,
From ancient grudge
break to new mutiny...

Lines
start at 1

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Solution: Write Every Third Line

```
try (BufferedReader in =  
    new BufferedReader(new FileReader(inputPath));  
    PrintWriter out =  
        new PrintWriter(new FileWriter(outputPath))) {  
    int counter = 1;  
    String line = in.readLine();  
    while (line != null) {  
        if (counter % 3 == 0)  
            out.println(line);  
        counter++;  
        line = in.readLine();  
    }  
} // Catch Exception
```

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Command Line I/O

- Standard Input – `System.in`
- Standard Output – `System.out`
- Standard Error – `System.err`

Input Stream

```
Scanner scanner = new Scanner(System.in);  
String line = scanner.nextLine();  
System.out.println(line);
```

Output Stream

Basic Stream Types

Live Exercises in Class (Lab)

Files and Paths

Easily Working With Files

Paths

- The location of a file in the file system

```
D:\input.txt
```

- Represented in Java by the Path class

```
Path path = Paths.get("D:\\input.txt");
```

- Provides **static methods** for **creating streams**

```
Path path = Paths.get("D:\\input.txt");

try (BufferedReader reader =
    Files.newBufferedReader(path)) {
    // TODO: work with file
} catch (IOException e) {
    // TODO: handle exception
}
```

Files (2)

- Provides **utility methods** for easy file manipulation

```
Path inPath = Paths.get("D:\\input.txt");  
Path outPath = Paths.get("D:\\output.txt");  
  
List<String> lines = Files.readAllLines(inPath);  
Files.write(outPath, lines);  
  
// TODO: handle exceptions
```

Problem: Sort Lines

- Read a text file and sort all lines
- Write the result to another text file
- Use Paths and Files classes

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Solution: Sort Lines

```
Path path = Paths.get("D:\\input.txt");
Path output = Paths.get("D:\\output.txt");

try {
    List<String> lines = Files.readAllLines(path);
    Collections.sort(lines);
    Files.write(output, lines);
} catch (IOException e) {
    e.printStackTrace();
}
```

Don't use for
large files

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

File Class in Java

Easily Working With Files

File Class in Java

- Provides methods for quick and easy manipulation of files

```
import java.io.File;

File file = new File("D:\\input.txt");

boolean isExisting = file.exists();
long length = file.length();
boolean isDirectory = file.isDirectory();
File[] files = file.listFiles();
```

Problem: List Files

- Print names and sizes of all files in "Files-and-Streams" directory
- Skip child directories

```
input.txt: [size in bytes]  
output.txt: [size in bytes]
```

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Solution: List Files

```
if (file.exists())  
    if (file.isDirectory())  
        File[] files = file.listFiles();  
        for (File f : files)  
            if (!f.isDirectory())  
                System.out.println(f.length());
```

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Problem: List Nested Folders

- You are given a folder named "Files-and-Streams"
- List all folder names, starting with the root
- Print folder count on the last line (including the root)

...

Streams-and-Files
Serialization
Streams-and-Files
[count] folders

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Solution: Nested Folders

```
String path = "D:\\Files-and-Streams";  
File root = new File(path);  
  
Deque<File> dirs = new ArrayDeque<>();  
dirs.offer(root);  
  
// continue...
```

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Solution: Nested Folders (2)

```
int count = 0;
while (!directories.isEmpty()) {
    File current = directories.poll();
    System.out.println(current.getName());
    count++;

    for (File dir : current.listFiles())
        if (dir.isDirectory())
            directories.offer(dir);
}
```

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Serialization

Serializing and Deserializing Objects

Serialization

- Save objects to a file

```
List<String> names = new ArrayList<>();  
Collections.addAll(names, "Mimi", "Gosho");  
  
FileOutputStream fos = new FileOutputStream(path);  
ObjectOutputStream oos =  
    new ObjectOutputStream(fos);  
  
oos.writeObject(names);  
  
// TODO: handle exceptions
```

Save objects
to **.ser** file

Deserialization

- Load objects from a file

```
FileInputStream fis =  
    new FileOutputStream(path);  
ObjectInputStream oos =  
    new ObjectInputStream(fis);  
  
List<String> names =  
    (List<String>) oos.readObject();  
  
// TODO: handle exceptions
```

Serialization of Custom Objects

- Custom objects should implement the **Serializable** interface

```
class Cube implements Serializable {  
    String color;  
    double width;  
    double height;  
    double depth;  
}
```

Problem: Serialize Custom Object

- Create a **Cube** class with color, width, height and depth
- Create a cube – color: "green", w: 15.3, h: 12.4 and d: 3

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Solution: Serialize Custom Object

```
class Cube implements Serializable {  
    String color;  
    double width;  
    double height;  
    double depth;  
}
```

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Solution: Serialize Custom Object (2)

```
String path = "D:\\save.ser";  
try (ObjectOutputStream oos =  
    new ObjectOutputStream(  
        new FileOutputStream(path))) {  
    oos.writeObject(cube);  
} catch (IOException e) {  
    e.printStackTrace();  
}
```

Check your solution here: <https://judge.softuni.bg/Contests/Practice/Index/403#0>

Files and Serialization

Live Exercises in Class (Lab)

Summary

- Streams are used to transfer data
- Two main types of streams
 - Input Streams
 - Output Streams
- Buffered streams boost performance
- Streams can be chained together
- You can save objects state into a file
